Lending Club Analysis

Introduction: Consumer Finance Company which specializes in lending various types of loans to urban customers. When the company receives a loan application, the company has to make a decision for loan approval based on the applicant's profile. Two **types of risks** are associated with the bank's decision:

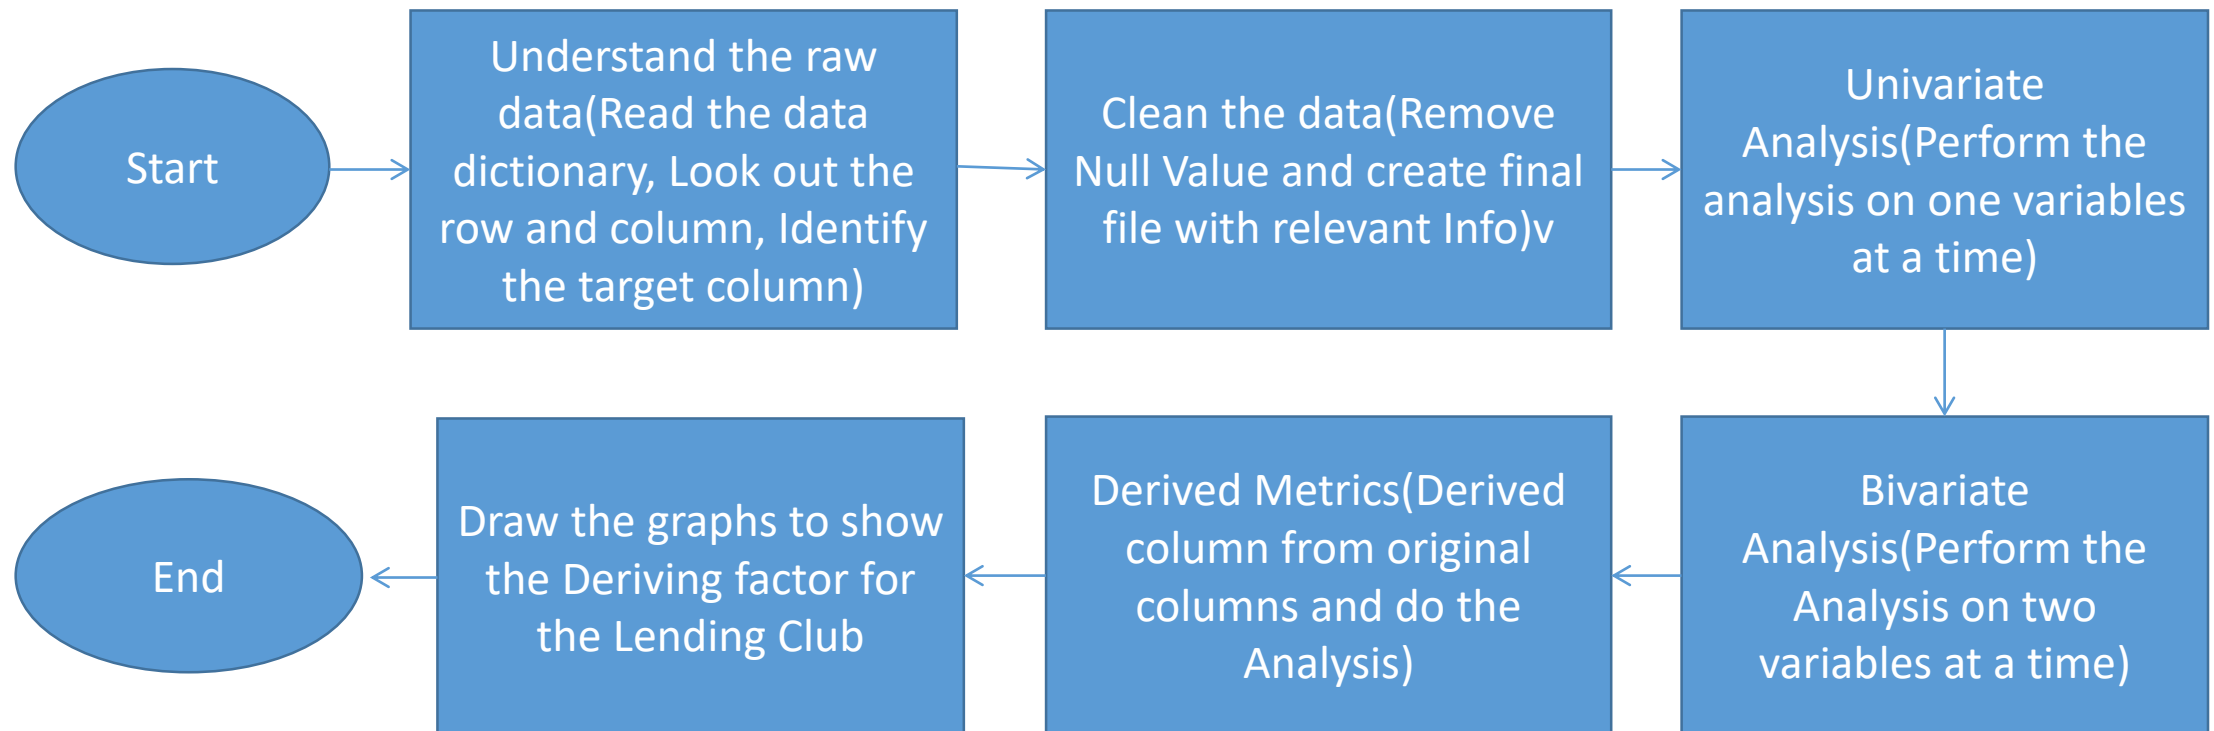

- If the applicant is **likely to repay the loan**, then not approving the loan results in a **loss of business** to the company
- If the applicant is **not likely to repay the loan**, i.e. he/she is likely to default, then approving the loan may lead to a **financial loss** for the company

Sample data of loan contains the information about past loan applicants and whether they 'defaulted' or not.

Objective:

The aim is to identify patterns which indicate if a person is likely to default, which may be used for taking actions such as denying the loan, reducing the amount of loan, lending (to risky applicants) at a higher interest rate, etc.

Flowchart

Analysis

- There are one loan file and one data dictionary provided in the file.
- Remove the null value and do relevant data cleaning
- Identify the major columns which indicate the default on the loan.

Loan Status: Current status of the loan. There are three categories:

- **Fully paid:** Applicant has fully paid the loan (the principal and the interest rate)
- **Current:** Applicant is in the process of paying the installments, i.e. the tenure of the loan is not yet completed. These candidates are not labeled as 'defaulted'.
- **Charged-off:** Applicant has not paid the installment's in due time for a long period of time, i.e. he/she has defaulted on the loan

Univariate Analysis

- Below graph shows relation Between Loan Amount Count vs Loan Status
- It is evident that around 5K Charged off Loan and 30K Fully Paid.
- Only around 57% of money is recovered from Charged off Loans.
- From Fully Paid loan, Lending club earning around 17% Profit.

Graph1: Loan Status vs Loan Amount

Graph2: Loan Status vs Loan Recovered

Univariate Analysis

- It is evident from the plot that as the grade of loan goes from A to G, the default rate increases. This is expected because the grade is decided by Lending Club based on the risk nature of the loan.
- From the above graph, we can see that the following "purpose" are the ones which is strongest contender of being defaulted.

→ Small business , Renewable Energy and educational

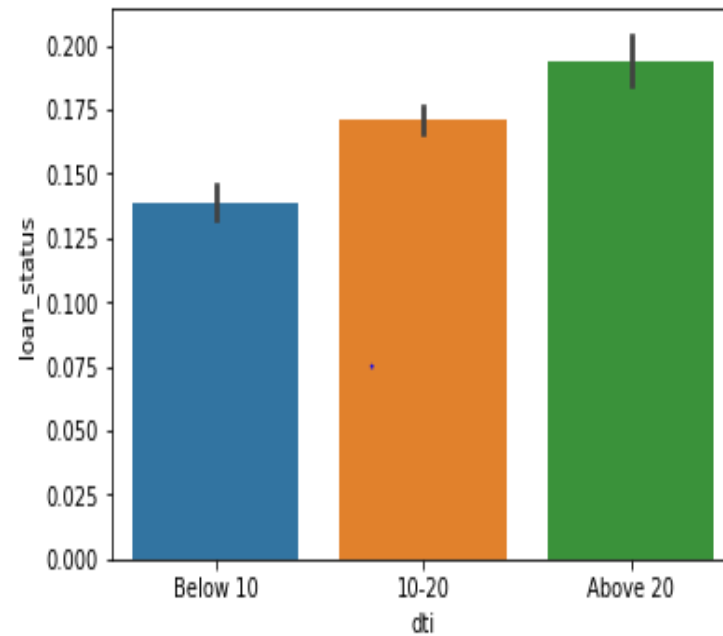

Univariate Analysis

- It clearly shows that loan taken for a longer term which is 60 months is a stronger candidate for default.
- It is evident from the plot that as the sub-grade of loan goes from A1 to A2, A2 to A3, A3 to A4 and A4 to A5, the default rate increases. This is expected because the sub-grade is also decided by Lending Club based on the riskiness of the loan.

Univariate Analysis

- It clearly shows that higher risk of default where DTI Relation is greater than 15.
- It is clearly visible that higher debt to ratio values have higher risk of defaulting.
- It is clear from the plot that higher the value of "loan Amount", greater is the risk of defaulting.

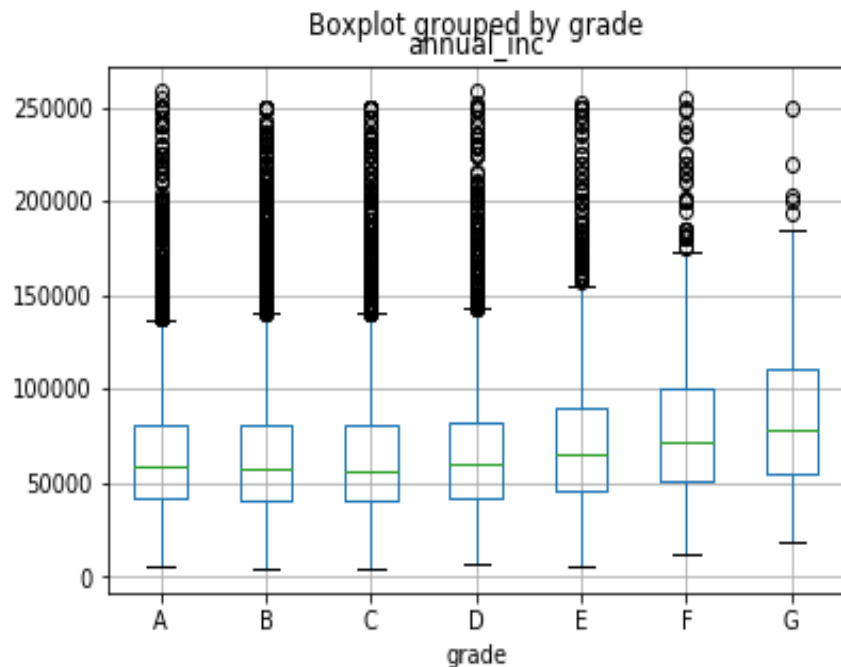

Bivariate Analysis

- From the Box Plot it clears that Annual Income varies from 4000 to 6000000
- It is evident that people having lesser salary, less than 50000 and who have taken loan of 25000 and higher has a higher chance of defaulting.

Bivariate Analysis

- From the graph, it shows that grade actually decreases with the increase in the loan amount
- It is evident from the plot that as the sub-grade of loan goes from A1 to A2, A2 to A3, A3 to A4 and A4 to A5, the default rate increases. This is expected because the sub-grade is also decided by Lending Club based on the riskiness of the loan.

Bivariate Analysis

- From the graph, it shows that **Higher interest rates are likely to be charged off.**
- It is evident from the People having higher utilization revolving line of credit having higher interest rate which drives potential defaults.

Conclusion

- Stop the approval of loan where purpose is Small business.
- Stop approval of loan with higher amount.
- Stop approval of loan where annual income is low.
- Reduce the loan amount where DTI ratio is higher.
- Approve the loan where loan amount is lower.
